

MilkWise — Diagram Preview (Option 3 style)

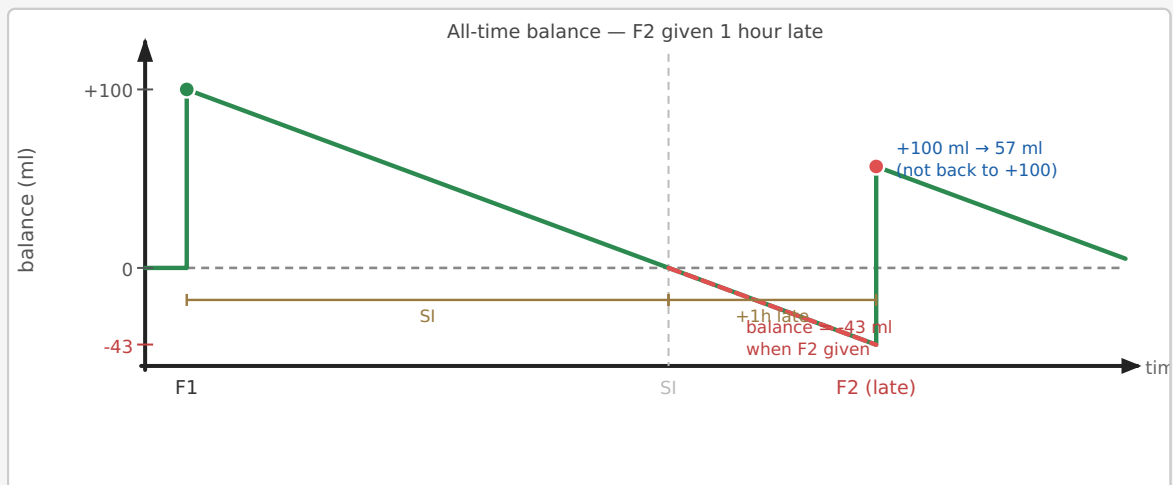

§3.1 All-time balance — perfect rhythm

Saw-tooth: each feed spikes to +100 ml, decays linearly to 0 over SI.

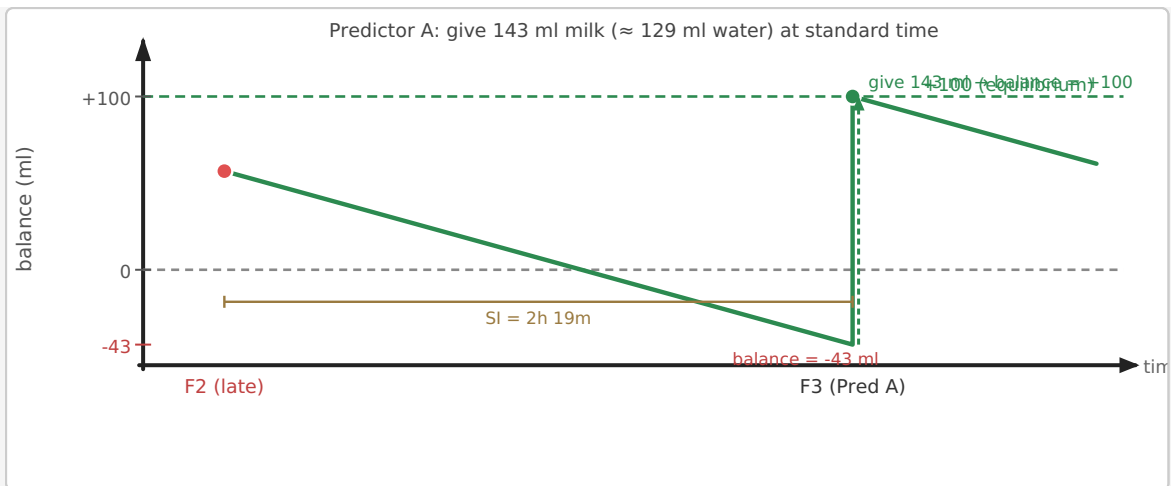

§3.1 All-time balance — late feed

F2 given 1 hour late. Balance falls to -43 ml before F2; recovers only to +57 ml.

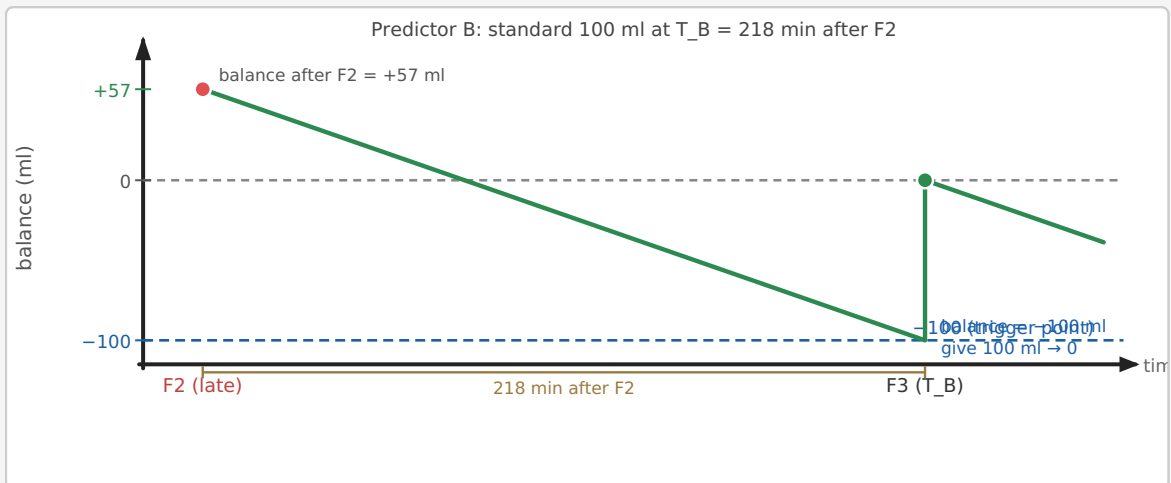

§3.1 Predictor A on all-time balance

Give 143 ml at the standard time (SI after F2) to restore equilibrium.

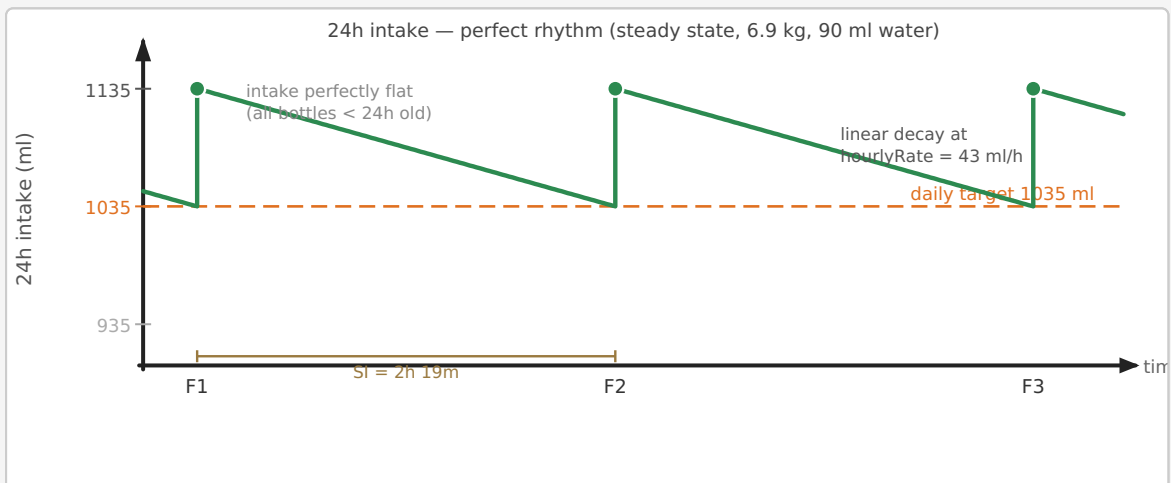

§3.1 Predictor B on all-time balance

Give 100 ml when balance = -100 ml (3h 39m after F2).

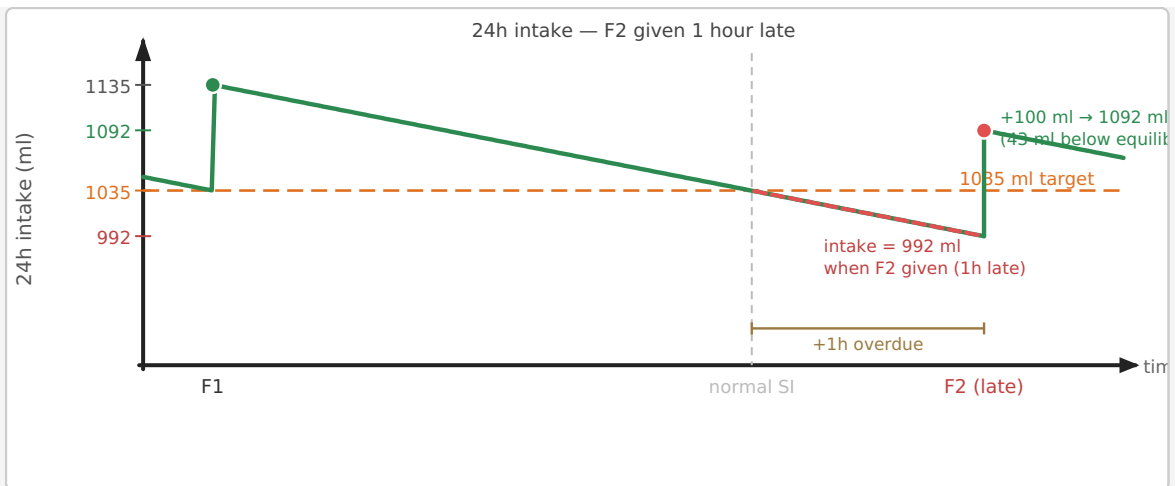

§3.4 24h intake — perfect rhythm (steady state)

Intake flat between feeds (all bottles < 24 h old), decays once oldest crosses 24h mark.

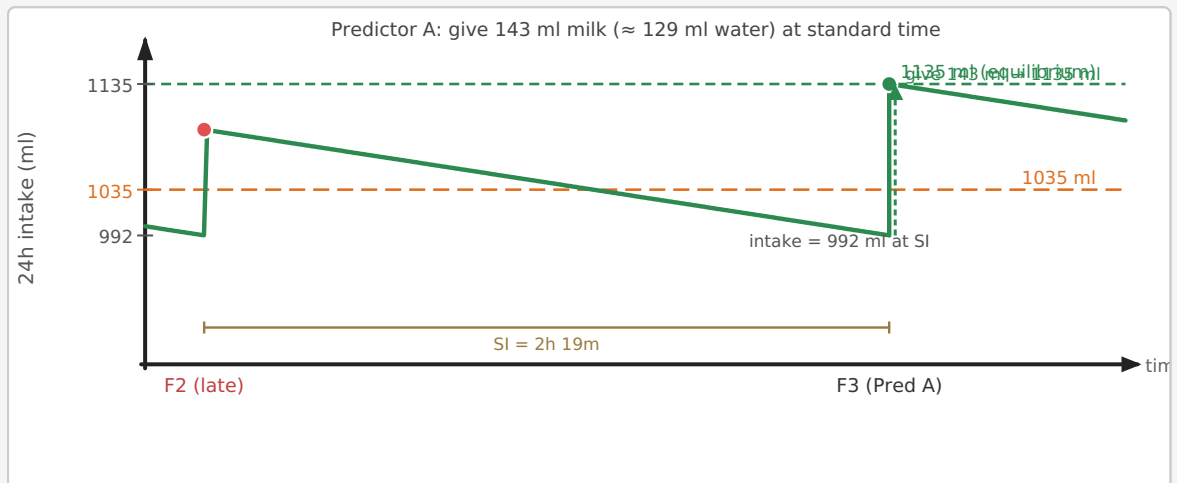

§3.4 24h intake — late feed

F2 given 1 hour late. Intake falls to 992 ml; recovers only to 1092 ml (43 ml below equilibrium).

§3.4 Predictor A on 24h model

Give 143 ml at SI after F2 → intake returns to 1135 ml (equilibrium).

§3.4 Predictor B on 24h model

Give 100 ml when intake = 1035 ml (daily target) — naturally restores to 1135 ml.
